"They found it very intriguing, especially considering we
were going for a grant no other
high school had ever gotten,"
Emily said. "They were very
encouraging about it."

Mukherjee confirmed he was
impressed with Simmons and
his students and intended to
round up some fellow space
researchers to visit the academy. But he said he could make
no funding commitments.

The consortium's grant program has an education component, but it has funded only university projects so far and is competitive, he said.

Still, the Tekna-Theos group's bio-reactor idea "is a good project," he said. "It is not earth-shattering, but it is something that... could give them exposure."

Also, their work could make them role models among other high school students, he said.
Since the Kennedy Space Center visit, the students have gotten back to the job at hand—researching the materials they will need for the bioreactor, getting cost estimates and looking for more grant sources. Also, they are prepar-

Ing a Web site on their project.

The encouragement they have received from Simmons and Mukherjee and his colleagues — and the possibility that something they created might one day be a research tool in space — keeps them going.

"It's just mind-boggling,"

Emily said.
